

Subject: Pre-Confirmation Brief – AI Assistant + AI Booking System + Omnichannel SaaS Platform

Hello,

Thank you for your proposal.

Before I confirm the final developer/designer for this project, I want to clearly define the exact product I am building so there is no misunderstanding.

This is not a basic chatbot project.

It is an AI Assistant + AI Booking System with omnichannel inbox, knowledge base, backend booking/pricing logic, CRM pipeline, SaaS-ready architecture, and Android mobile app.

The benchmark is a platform similar to WIRAL, but my goal is to build a system that is more tailored, more structured for sales and booking, and more scalable for use across different industries.

1. PRODUCT VISION

The platform will first be used for Tugatai, but the system must be built in a way that it can later be sold to other companies across GCC, Africa, and Asia, including businesses in logistics and other sectors.

So this is both:

1. an internal operating system for Tugatai
2. a future multi-tenant SaaS product

The core concept is:

- AI Assistant for answering, guiding, and capturing intent
- AI Booking System for collecting customer data and completing quote/booking workflows
- All Channels, One Inbox
- No lead should be missed
- Human agent takeover must be possible at any time

2. WHAT THIS SYSTEM IS NOT

This is not:

- a simple predefined chatbot

- a button-based FAQ bot
- a generic GPT chat widget
- a basic n8n automation only
- a single-channel WhatsApp tool only

The system must behave like a real AI Agent connected to:

- a Knowledge Base
- a structured booking flow
- a backend business logic engine
- a CRM / lead pipeline
- an omnichannel inbox
- a mobile app

3. CHANNELS TO BE CONNECTED

The platform should support a unified inbox for the following channels:

Priority channels

- WhatsApp Cloud API
- Instagram
- Facebook Messenger
- Website Live Chat / Web Chat

Secondary / optional channels

- Telegram
- LinkedIn (future phase)

All customer conversations from these channels must be centralized into one unified inbox.

4. CORE FUNCTIONAL AREAS

A. Omnichannel Inbox

A shared inbox where all customer conversations are visible in one place.

Required capabilities:

- one inbox for all connected channels
- separate inboxes / routing if needed by region or business unit
- unified conversation history
- agent assignment
- internal notes
- tags and labels

- lead status tracking
- business hours / availability settings
- bot configuration settings
- CSAT / customer satisfaction support
- collaborator / team access

This should feel like a modern shared support and sales inbox, similar to WIRAL / Chatwoot style architecture.

B. AI Assistant

The AI must:

- understand customer intent
- ask dynamic follow-up questions
- answer questions from company knowledge base
- support multilingual conversations where possible
- maintain conversation context
- guide users through inquiry, quote, and booking flows
- escalate to a human when needed

This should work like an AI Agent, not a fixed-script bot.

C. AI Booking / Quote System

This is one of the most important parts.

The AI must collect structured customer information such as:

- destination country / city
- item type
- item count
- weight
- dimensions if needed
- TV size if applicable
- pickup location
- timeline / urgency
- other booking details relevant to the business

Important rule:

The AI must not calculate pricing on its own.

Correct flow:

1. AI collects and extracts structured data from the conversation

2. AI sends the structured data to the backend logic
3. Backend pricing engine calculates the correct quote
4. AI formats and presents the result clearly to the customer

For Tugatai, the pricing engine must be driven by our actual business logic, such as:

- cargo rates
- TV rates
- product rates
- car shipping rates
- customs fee
- location-based delivery logic
- volumetric / CBM conversion rules if required

D. Knowledge Base (KB)

The AI must be connected to a knowledge base.

This KB should contain:

- company information
- policies
- services
- FAQs
- delivery timelines
- rate explanations
- booking requirements
- product/service rules
- office / delivery point info
- other structured business knowledge

The AI should use the knowledge base to answer correctly and consistently.

E. CRM / Lead Management

This is not just messaging. It must also function as a lead and sales system.

Required capabilities:

- lead capture from every conversation
- lead tracking through stages
- conversation-to-lead linking
- follow-up reminders
- pipeline view
- notes and activity logs
- agent ownership

- booking conversion tracking

Suggested statuses:

- New
- Cold
- Warm
- Hot
- RFQ
- Quoted
- Confirmed
- Booked
- Closed / Lost

F. Admin Panel

The platform must include a strong admin panel.

Admin capabilities should include:

- manage users and roles
- manage businesses / tenants
- manage channels
- manage pricing tables
- manage templates
- manage automations
- manage AI behavior and escalation rules
- manage knowledge base content
- manage inbox settings
- view reports and analytics
- manage onboarding / setup for new clients

G. SaaS-Ready Multi-Tenant Architecture

This is critical.

The system must be designed as SaaS-ready architecture from the beginning.

That means:

- multiple businesses can use the platform
- each client has separate data
- each client can connect their own channels
- each client can have their own users / agents
- each client can have their own pricing logic or business rules
- each client can have their own branding / settings
- data isolation must be maintained properly

Even if Phase 1 starts with Tugatai only, the architecture must support future multi-tenant SaaS expansion.

H. Android Mobile App

Do not forget this part.

I need an Android mobile app for operational use.

The mobile app should support:

- live chat / inbox access
- push notifications
- agent reply to customers
- lead view / status update
- basic CRM actions
- human takeover from mobile
- quick access to conversations and notes

At minimum, the Android app should be a useful operational companion to the web dashboard.

If full feature parity is not in Phase 1, the roadmap should clearly show what will be included in mobile first and what will come later.

5. TARGET ARCHITECTURE (LIKE WIRAL OR BETTER)

Based on my research, WIRAL appears to be structured around:

- inbox layer
- webhook layer
- backend logic layer
- AI layer
- channel integrations
- business logic / booking system

That is also the direction I want.

Recommended high-level architecture

1. Channel Layer

- WhatsApp Cloud API
- Instagram
- Facebook Messenger

- Website Live Chat
- Telegram
- LinkedIn (future)

2. Inbox Layer

A unified inbox system, either:

- built on top of Chatwoot-like architecture, or
- a custom inbox if there is a strong reason

This layer handles:

- conversations
- agents
- notes
- inbox routing
- collaboration

3. Webhook / API Layer

Every incoming message should pass through backend APIs / webhook processing.

Example responsibilities:

- receive message events
- normalize channel payloads
- store conversation data
- send message to AI layer / workflow engine
- send response back to channel

4. AI Layer

This layer should use OpenAI or equivalent model for:

- intent understanding
- entity extraction
- KB-based answering
- structured response generation

5. Backend Logic Layer

This is the most important layer.

Responsibilities:

- pricing engine
- booking validation
- workflow logic
- escalation rules
- customer / lead records
- CRM state updates
- automation rules

This layer must be deterministic and business-rule driven.

6. Data Layer

Database must store:

- businesses / tenants
- channels
- users / agents
- leads
- conversations
- messages
- knowledge base content
- pricing tables
- booking data
- activity logs
- templates
- automation rules

7. Mobile + Web Application Layer

- web admin dashboard
- web inbox / CRM
- Android app for agents and operations

6. TECHNOLOGY UNDERSTANDING

Based on direct feedback from the WIRAL owner, systems like this use:

- OpenAI as the AI model
- Python or another backend language as the programming layer

Important note:

OpenAI and Python are not alternatives.

OpenAI is the model / intelligence layer.

Python is the backend programming layer.

So a correct implementation may use:

- OpenAI for AI behavior
- Python or Node.js for backend logic
- database for structured data
- inbox layer for conversations
- APIs/webhooks to connect everything

I am open to the exact tech stack if well justified, but the architectural separation must be correct.

7. IMPORTANT IMPLEMENTATION RULES

Any designer / developer working on this must understand these rules:

Rule 1

The AI must not guess or calculate business pricing directly.

Rule 2

All critical business logic must be executed in backend logic / APIs.

Rule 3

The platform must be designed as a product, not just a one-off project.

Rule 4

The user experience must support:

- AI assistant
- human takeover
- booking completion
- lead management
- team collaboration

Rule 5

The architecture must support future SaaS expansion and not block scaling later.

8. DESIGN EXPECTATIONS

The design must cover, at minimum:

- landing / onboarding screens
- login / auth
- omnichannel inbox UI
- AI + human chat thread interface
- lead pipeline / CRM
- admin panel
- pricing / booking management screens
- knowledge base management screens
- analytics / reports
- tenant / business settings
- Android mobile screens for chat + lead handling

Design should be:

- modern
- scalable
- clean
- SaaS-grade
- fast to use for operations teams
- suitable for sales, support, and booking workflows

9. PHASE-BASED EXECUTION PREFERENCE

I am open to phased delivery, but the overall architecture must stay aligned with the complete product.

Example phase direction

Phase 1

- WhatsApp integration
- AI assistant
- pricing / booking engine
- inbox core
- admin basics
- Android app basic operations

Phase 2

- Instagram / Facebook / Web chat / Telegram
- CRM improvements
- analytics
- more advanced automations

Phase 3

- multi-tenant SaaS rollout
- client onboarding
- subscriptions / billing
- white-label / branding options

Even if phases are used, the final architecture must not force a rebuild.

10. WHAT I NEED FROM YOU BEFORE FINAL SELECTION

Please confirm clearly:

1. your understanding of this product vision
2. whether you have experience with similar SaaS / omnichannel / AI systems
3. your recommended architecture
4. your recommended tech stack
5. whether you will use inbox architecture similar to Chatwoot or fully custom
6. how you will separate AI logic from backend business logic
7. how you will handle mobile app for Android
8. your delivery plan, timeline, and cost by phase
9. whether the solution will be SaaS-ready from the beginning
10. whether full source code and ownership will be transferred

11. FINAL NOTE

I am not looking for the cheapest quote.

I am looking for the right partner who truly understands the difference between:

- a simple chatbot
- an AI assistant
- an AI booking system
- and a SaaS product platform

The right person for this project must be able to think in terms of:

- architecture
- scalability
- product design
- AI + backend integration
- booking workflow
- and long-term SaaS growth

Please respond only after carefully reviewing this full brief.

Best regards,
Robert
